

SALES PERFORMANCE REVIEW

# A year of pizza, in numbers

I analysed every order the pizzeria took in 2015. This report covers what sells, when the kitchen is busy and when it sits idle, what to cut from the menu, and where the next **+\$39K** of revenue can come from.

October 2026

THE SHORT VERSION

# A stable business with clear room to grow

Sales were steady all year, with no month dropping off a cliff. The upside is in three places: the dead hours after lunch, the slow Sunday and Monday, and group orders, which already bring in almost 40% of revenue. The menu also has a long tail that adds complexity without adding money.

|                                            |                       |
|--------------------------------------------|-----------------------|
| 21,350<br>orders                           | 49,574<br>pizzas sold |
| 32<br>pizza types · 4 categories · 5 sizes | 358<br>trading days   |

8 KEY FINDINGS

- 01

\$817.9K revenue, average order \$38.31
- 02

Months vary by only 13%: July is the peak, October the low
- 03

Friday is the busiest day; lunch and 5–7 pm are the peaks
- 04

Chicken pizzas lead on revenue, Classic Deluxe on volume
- 05

Size L = 45.9% of revenue; XL/XXL just 1.8%
- 06

Brie Carré is the clear item to remove
- 07

4+ pizza orders: 18% of orders, 39% of revenue
- 08

Two targeted promos are worth +\$38.9K a year

SOURCES

# 4 tables, one star schema

The core of the model is **order\_details**: one row per pizza line in an order. It links to orders (when), pizzas (size and price) and pizza types (name and category).

Every relationship is **one-to-many**, and the joins in my queries follow them exactly: `USING(order_id)`, `USING(pizza_id)`, `USING(pizza_type_id)`.

# Five steps to a clean table

|                                                                                               |                                                                                                            |                                                                                                       |                                                                                                                           |                                                                                                           |
|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <div>01</div> <div>Import</div> <div>Loaded 4 CSV files into SQLite as separate tables.</div> | <div>02</div> <div>Key checks</div> <div>Primary keys are unique, and every foreign key has a match.</div> | <div>03</div> <div>Missing values</div> <div>0 NULLs across all 12 fields of the final dataset.</div> | <div>04</div> <div>Data types</div> <div>CAST price to REAL and quantity to INTEGER so the totals add up correctly.</div> | <div>05</div> <div>Derived fields</div> <div>strftime to get month, weekday and hour of each order.</div> |
|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|

|                                                        |                                                       |
|--------------------------------------------------------|-------------------------------------------------------|
| <div>48,620</div> <div>rows exported to Tableau</div>  | <div>12</div> <div>fields</div>                       |
| <div>49,574</div> <div>pizzas, counting quantity</div> | <div>365</div> <div>days · Jan 1 – Dec 31, 2015</div> |

Key rule: pizzas sold = **SUM(quantity)**, not the row count. Counting rows would miss **954 pizzas**.

```
SELECT

```

— HEADLINE NUMBERS

The pizzeria made  
\$817.9K in 2015

\$38.31

AVERAGE ORDER VALUE

21,350 orders and 49,574 pizzas over the year. The average order holds 2.32 pizzas: a typical customer orders for two or for a group, not just for themselves. That makes order size a real lever.

|                     |                  |

MONTHLY TREND

Sales are **stable** all year round

13%

GAP BETWEEN THE BEST AND WORST MONTH

**July** was the strongest month (\$72,558 from 1,935 orders), and **October** the weakest (\$64,028). Month-to-month changes stay within  $\pm 10\%$  and there is no strong seasonality. September–October is the quietest stretch, so that's when a campaign would help most.

BELOW: CHANGE VS PREVIOUS MONTH

WORKLOAD

# Friday peaks, Sunday is quiet

70.8

ORDERS ON AN AVERAGE FRIDAY

**Friday** is the busiest day of the week. **Sunday** is the quietest (50.5 orders, 29% fewer), and the other days sit between 57 and 62. Each day has two peaks: **lunch 12–1 pm** (~7 orders an hour) and **evening 5–7 pm**. In between, 2–4 pm is a clear slump.

BEST & WORST SELLERS

Bestsellers by revenue  
and by volume are **not**  
the same

3 of 5

OVERLAP IN BOTH TOP AND BOTTOM LISTS

**Thai Chicken** brings in the most revenue (\$43.4K), while **Classic Deluxe** sells the most units (2,453). Chicken pizzas are priced higher, so they climb the revenue ranking. **Brie Carré** comes last on both.

TOP 5 BY REVENUE

|   |                    |         |
|---|--------------------|---------|
| 1 | Thai Chicken •     | \$43.4K |
| 2 | Barbecue Chicken • | \$42.8K |
| 3 | California Chicken | \$41.4K |
| 4 | Classic Deluxe •   | \$38.2K |
| 5 | Spicy Italian      | \$34.8K |

BOTTOM 5 BY REVENUE

|   |                   |         |
|---|-------------------|---------|
| 1 | Brie Carré •      | \$11.6K |
| 2 | Green Garden      | \$14.0K |
| 3 | Spinach Supreme • | \$15.3K |
| 4 | Mediterranean •   | \$15.4K |
| 5 | Spinach Pesto     | \$15.6K |

TOP 5 BY UNITS SOLD

|   |                    |             |
|---|--------------------|-------------|
| 1 | Classic Deluxe •   | 2,453 units |
| 2 | Barbecue Chicken • | 2,432 units |
| 3 | Hawaiian           | 2,422 units |
| 4 | Pepperoni          | 2,418 units |
| 5 | Thai Chicken •     | 2,371 units |

BOTTOM 5 BY UNITS SOLD

|   |                   |           |
|---|-------------------|-----------|
| 1 | Brie Carré •      | 490 units |
| 2 | Mediterranean •   | 934 units |
| 3 | Calabrese         | 937 units |
| 4 | Spinach Supreme • | 950 units |
| 5 | Soppressata       | 961 units |

• = appears in both lists of the pair

CATEGORIES & SIZES

Large pizzas **carry** the business

45.9%

OF REVENUE COMES FROM SIZE L

**L brings in 45.9%**, M 30.5% and S 21.8%, while **XL and XXL together make up only 1.8%**. The categories are well balanced, from 23.7% (Veggie) to 26.9% (Classic), so revenue doesn't depend on any single category.

REVENUE SHARE BY SIZE

REVENUE SHARE BY CATEGORY

SHARE • UNITS SOLD

MENU TAIL

Brie Carré is the one to cut first

1.42%

OF REVENUE • ONLY 490 SOLD ALL YEAR

**Brie Carré** sells half as much as any other pizza. Next in line are **Green Garden, Spinach Supreme, Mediterranean and Spinach Pesto**: together the bottom 5 make up **8.8% of revenue (\$71.8K)**. Items 2–10 perform almost the same (~930–1,000 units, 1.7–2.1% each), and the bottom 10 together = **18.8%**.

10 WEAKEST PIZZAS: REVENUE SHARE

■ CRITICAL • ■ WEAK • Σ = CUMULATIVE SHARE

LARGE ORDERS

# Group orders punch far above their weight

18 → 39%

SHARE OF ORDERS → SHARE OF REVENUE

3,880 orders with 4+ pizzas brought in **\$322,571**. Their average ticket is **\$83.14**, 2.9× a regular order (\$28.35). A dedicated offer for families and offices is clearly worth it.

SHARE OF ORDERS

SHARE OF REVENUE

**\$83.14**

avg ticket • 4+ pizzas

**\$28.35**

avg ticket • 1-3 pizzas

PROMOTION WINDOWS

Two quiet windows are  
ready for a promo

+\$38.9K

YEARLY UPSIDE OF TWO PROMOS AT +10%

After lunch, revenue almost halves: from **\$111.9K** at 12:00 to **\$53.0K** at 15:00. The **2:00–4:59 pm** window brings in \$182,249, so +10% = **+\$18,225**.  
**Sunday and Monday** are the weakest days (\$206,533 combined), so +10% = **+\$20,653**.

# Explore every finding on **one** interactive dashboard

OPEN IN TABLEAU ↗

THREE THINGS TO REMEMBER

# The money is in big baskets, peak hours and size L

18 → 39%

One in five orders brings in two-fifths of revenue

Orders with 4+ pizzas are 18.2% of all orders but 39.4% of the money. Average ticket: \$83 vs \$28.

−53%

Revenue halves after lunch

It falls from \$111.9K at 12:00 to \$53.0K at 15:00. The kitchen and staff are already in place but the orders aren't, which makes this the cheapest window to grow.

1.8%

Almost nobody buys XL or XXL

L brings in 45.9% of revenue and M 30.5%. The oversized options and Brie Carré make the menu more complex without bringing in more money.

WHAT I RECOMMEND

# Three actions, each backed by a number

01 • TIMING

## Afternoon Happy Hours, 2–5 pm

ACTION

10–15% off a personal combo (S/M pizza + drink), aimed at office workers, students and late lunches.

EVIDENCE

Revenue at 15:00 is **\$53.0K** vs **\$111.9K** at 12:00. The 2–5 pm window brings in **\$182,249** a year.

**+\$18.2K**

per year at  
+10% in the window

02 • BASKET SIZE

## Family & Office Pack on Sunday–Monday

ACTION

A "3+1" deal (the 4th pizza is free) or a free 2L drink with any order of 4+ pizzas.

EVIDENCE

Sun **\$99.2K** and Mon **\$107.3K** are the weakest days, and 4+ pizza orders already bring in **39.4%** of revenue.

**+\$20.7K**

per year at  
+10% on Sun & Mon

03 • MENU

## Trim the menu's long tail

ACTION

Remove **Brie Carré** now, and run a 2-month test without the other 4 weakest items while tracking revenue.

EVIDENCE

Brie Carré = **1.42%** of revenue (490 units). The bottom 5 = **8.8%**; XL/XXL = **1.8%**.

**–5 items**

simpler purchasing,  
risk ≤ \$11.6K/yr

— AN HONEST LOOK AT THE DATA

# What the data doesn't tell us, and how to fix it

LIMITATIONS

- **Only one year (2015):** no year-over-year comparison, so seasonality isn't confirmed.
- **358 of 365 days** have orders. 7 days are missing, likely holidays or closures.
- **No cost data:** this report covers revenue, not profit margin.
- **No customer or channel data:** repeat customers, delivery vs dine-in are invisible.
- **+10% is a scenario**, not a forecast. The promo impact still needs testing.

NEXT STEPS

- **A/B test the promos** for 4–6 weeks against control weeks.
- **Add ingredient costs** to measure margin per pizza.
- **Basket analysis:** which pizzas are bought together, to design combos.
- **Hourly demand forecast** to plan staff shifts.
- **Collect 2016 data** and repeat the trend analysis.

— GRAZIE

# Thank you.

Questions are welcome. I'm happy to walk through any query or chart in more detail.
